

Git Commands to commit and push updates

Dalawang command para maconnect nyo sa github account ang local repo ninyo

```
git config --global user.email "registered_email_sa_github"
```

```
git config --global user.name "username_ninyo_sa_github or kahit name mo na lang"
```

Ito ay para mapalitan yun remote url ng bagong clone na repo. Gawa kayo ng bagong repo tas sundan niyo ang mga commands na nasa baba.

```
$ git remote set-url <remote-name> <remote-url>
```

```
git remote set-url origin https://github.com/username_ninyo_sa_github/repository_na_bago.git
```

```
example: git remote set-url origin https://github.com/ronmarasigan/test.git
```

Kapag magcocommit at push ng update from local to remote url.

1. git status – para makita kung may update from local versus yung nasa remote

2. git add . / git add -A or isa isa (git add file)

3. git commit -m "reason of your update"

4. git push
